

Webinar series: Advanced nephrology and urology

Decision making around minimally invasive management of stone disease - latest technologies

Key Areas

- Endoscopy of the lower urinary tract
- Minimally invasive cystotomy
- Laser lithotripsy

What are laser lithotripsy, extra-corporeal shock wave lithotripsy (ESWL) and minimally invasive cystotomy, and when are they viable treatment options for stone disease in dogs and cats?

In this webinar the different minimally invasive techniques for managing stone disease will be introduced with illustrative case examples. The decision making process for case selection will be discussed.

Why do this course?

This course is aimed at veterinary surgeons who would like to understand when referral for laser lithotripsy might be a viable option, what areas of the urinary tract can be accessed endoscopically in dogs and cats, and the steps involved in performing a minimally invasive cystotomy
